

Financial Product Analysis Project

1. Ask (Define the Objective)

The goal of this project was to analyze the performance of 11 agents selling financial (insurance) products. Specifically, the objective was to explore whether call duration or the number of calls influenced sales, and to measure individual agent performance—potentially for use in commission structures.

2. Prepare (Data Collection & Cleaning)

The dataset was sourced from Kaggle and contained columns like:

- AgentID, FirstName, LastName
- Call Duration, Client Picked Up (Yes/No)
- Number of Financial Products Sold

Cleaning steps included:

- Handling negative call durations by replacing them with 0 (calls that were never answered).
- Standard steps like trimming, changing data types, and concatenating names.
- Splitting the data into two tables: Agents and Sales with a one-to-many relationship.

3. Process (Transform Data)

- Created calculated columns for revenue (no. of products sold × \$150).
- Converted call durations into hours for better visualization.
- Imported agent images via URLs, using a free hosting site (imgbb.com).
- Sized and standardized all images before uploading.
- Added image URLs to the dataset and configured visuals using “Image by CloudScope”.

4. Analyze (Create Visuals & Insights)

Overview Report Page included:

- Table ranking agents by total sales.
- Bar + line chart showing revenue per agent and call duration.
- General call statistics and performance metrics.

Agent Dashboard Page focused on:

- Total calls, duration, revenue per agent.
- Success vs. failed calls.
- Sales conversion percentages.

Insights:

Sales performance wasn't directly linked to number of calls or call durations. The best-selling agent didn't spend the most time on calls or make the most calls—pointing to persuasive ability and targeting as possible success factors.

5. Share (Dashboard & Report Deployment)

- Created a multi-page Power BI report.
- Ensured intuitive layout and interaction (e.g., selecting an agent's image or bar chart filters the dashboard to that agent).
